

# 1. Head

---

Your head sits on top of your neck.

It has seven holes: two eye holes, two ear holes, two nose holes and one cake hole.

You put pictures into your eye holes, sounds into your ear holes, air into your nose holes and cakes into your cake hole. (You can also put a wide variety of healthy fresh fruits and vegetables into your cake hole, but I mostly use mine for cake.)

That is all there is to know about your head.

## A&T'S FUN BODY PART FACT #1

In ancient times there was a race of people who used to carry their heads under their arms.

## 2. Hair

---

Hair is a hairy hair-like growth called 'hair'. It grows mostly out of a heady head-like growth called your 'head', which grows out of a necky neck-like growth called your 'neck', which grows out of a bodily body-like growth called your 'body'.

The bodily body-like growth called your 'body' also has lots of hair, but nowhere near as much as the heady head-like growth called your 'head'.

That is all there is to know about hair.

### A&T'S FUN BODY PART FACT #2

In ancient times people used to grow their hair really long and wrap it around their bodies because clothes hadn't been invented yet.

# 3. Face

---

Faces are a handy place on the front of the head to keep stuff like eyes, eyebrows, noses, mouths, cheeks, foreheads, chins, beards and moustaches right where you need them.

Faces are not a good place to keep dirty socks and underpants, sporting equipment, apple cores, lolly wrappers and other bits of rubbish. (The proper place to keep this stuff is on your bedroom floor.)

That is all there is to know about faces.

## A&T'S FUN BODY PART FACT #3

Every year in Australia more than 300 people have their faces ripped off by killer koalas from outer space.

head up

Thing that thing  
the head up is  
attached to

Electrician

Does anyone  
need a plumber?

No!  
Stupid  
plumber!!

Plumber

## 4. Eyes

---

Your eyes are two soft balls of jelly that help you to see stuff, but only when the stuff you need to see is right in front of you.

If you want to see stuff that is very far away, you will need a telescope.

If you want to see stuff that is really small, you will need a microscope.

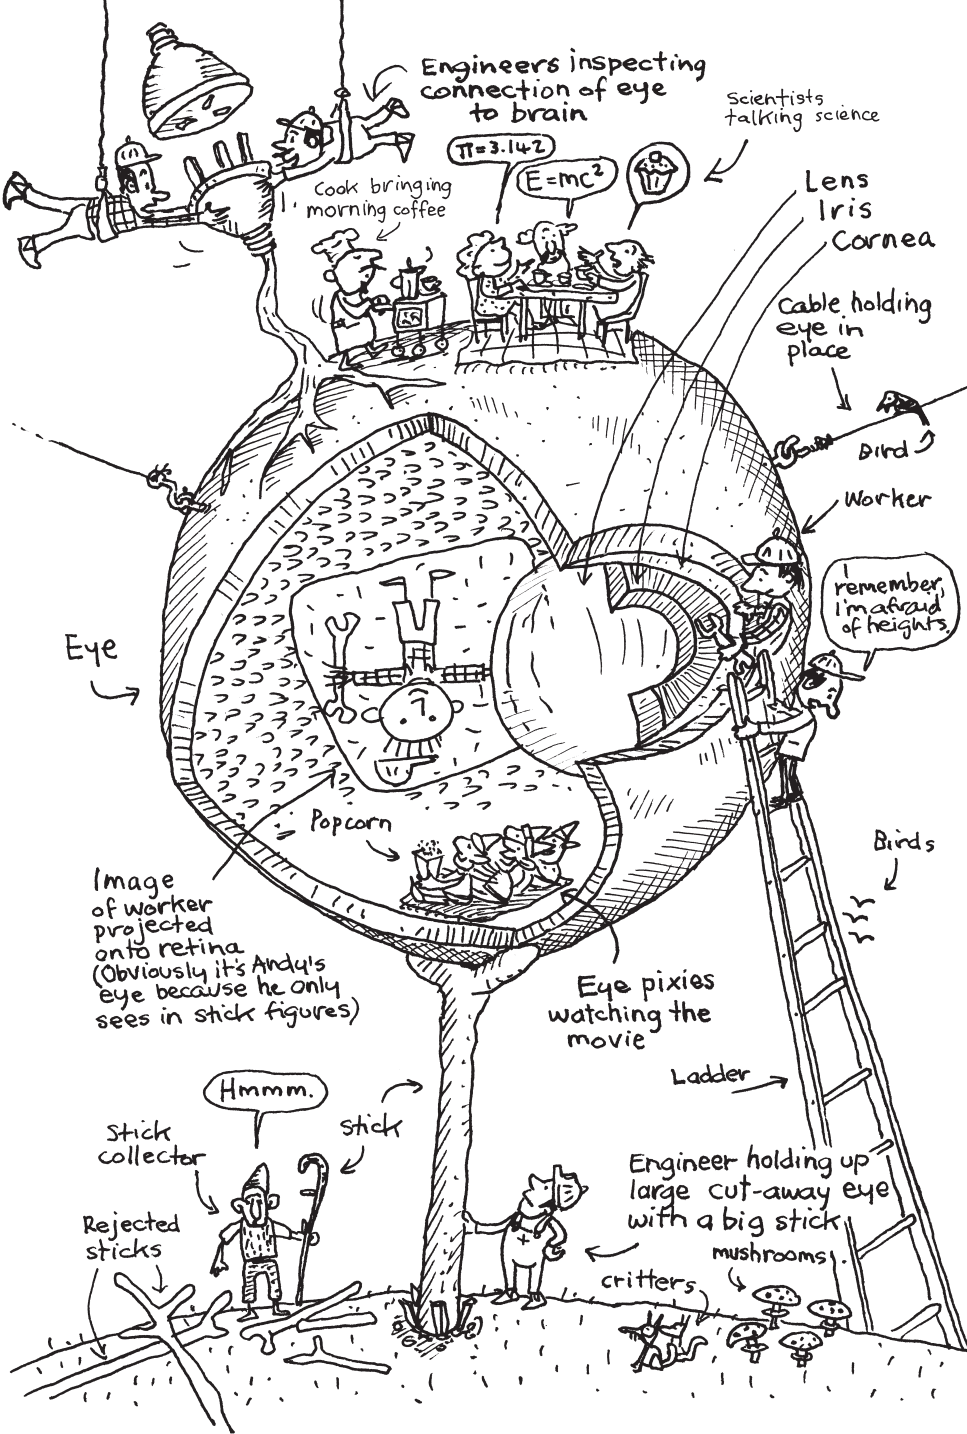

If you want to see something that's in a locked room and you don't have a key, you will need to take one of your eyeballs out of its socket and roll it under the door. (Don't forget to rinse your eyeball before you put it back in.)

That is all there is to know about eyes.

### A&T'S FUN BODY PART FACT #4

If you're walking around an old abandoned house late at night and you see a pair of eyeballs floating in midair, then you should get out of there immediately because those eyeballs probably belong to a GHOST!

Engineers inspecting connection of eye to brain

critters

# 5. Eyelids

---

Eyelids are conveniently located eyeball-sized flaps of skin that can be drawn down instantly to protect your eyeballs from bright lights, sandstorms, scary movies, sparks, people without clothes on, naked people, naked people without clothes on, people with clothes on but who are really naked underneath, onion fumes and the sharp end of pointy sticks.

That is all there is to know about eyelids.

## A&T'S FUN BODY PART FACT #5

Humans are the only animals that can blink *and* wink.

All other animals can blink but they never wink.

Unless, of course, they are doing it behind our backs when we're not looking.

# EYELIDS

## and OTHER KINDS OF LIDS
